- Rampage is a very eye-appealing, complete made, pigmented son of Encore and out of the renowned Gerber Rosy Lane cow family. He is a performance powerhouse (check out his birth to yearling spread) and a maternal giant, as well. Rampage is backed with ideal udders and tons of milk. He has consistently brought down birthweights at RHF and most of his offspring are conservatively marked.
- Calves born at Roth Hereford Farm between January 2018 and January 2019 have averaged 65.3 lb. Use Rampage for calving ease, performance and maternal excellence!
- Semen $30/straw. Certificates $75.
- Female-sexed semen also available.

Understanding Hereford EPDs

The American Hereford Association (AHA) currently produces expected progeny differences (EPDs) for 15 traits and calculates four profit ($) indexes. Research is ongoing to develop traits for fertility, feed intake and docility.

Today, DNA-marker tests can be used to enhance the accuracy of Hereford EPDs. AHA blends marker information with phenotypic information and pedigree to produce a GE-EPD. Look for the GE-EPD logo denoting an animal has been tested.

The current suite of Hereford EPDs and $ indexes includes:

Calving Ease – Direct (CE)
CE EPD is based on calving ease scores and birth weights and is measured on a percentage. CE EPD indicates the influence of the sire on calving ease in females calving at 2 years of age. For example, if sire A has a CE EPD of 6 and sire B has a CE EPD of -2, then you would expect on average if comparably mated, sire A's calves would be born with an 8% more likely chance of being unassisted when compared to sire B's calves.

Birth Weight (BW)
BW EPD is an indicator trait for calving ease and is measured in pounds. For example, if sire A has a BW EPD of 3.6 and sire B has a BW EPD of 0.6, then you would expect on average if comparably mated, sire A's calves would come 3 lb. heavier at birth when compared to sire B's calves. Larger BW EPDs usually, but not always, indicate more calving difficulty. The figure in parentheses found after each EPD is an accuracy value or reliability of the EPD.

Weaning Weight (WW)
WW EPD is an estimate of pre-weaning growth that is measured in pounds. For example, if sire A has a WW EPD of 60 and sire B has a WW EPD of 40, then you would expect on average if comparably mated, sire A's calves would weigh 20 lb. heavier at weaning when compared to sire B's calves.

Yearling Weight (YW)
YW EPD is an estimate of post-weaning growth that is measured in pounds. For example, if sire A has a YW EPD of 100 and sire B has a YW EPD of 70, then you would expect on average if comparably mated, sire A's calves would weigh 30 lb. heavier at a year of age when compared to sire B's calves.

Maternal Milk (MM)
The milking ability of a sire's daughters is expressed in pounds of calf weaned. It predicts the difference in average weaning weights of sires' daughters' progeny due to milking ability. Daughters of the sire with a +14 MM EPD should produce progeny with 205-day weights averaging 24 lb. more (as a result of greater milk production) than daughters of a bull with a MM EPD of -10 lb. (14 minus -10.0 = 24 lb.). This difference in weaning weight is due to total milk production during the entire lactation.

Maternal Milk & Growth (M&G)
Maternal Milk & Growth reflects what the sire is expected to transmit to his daughters for a combination of growth genetics through weaning and genetics for milking ability. It is an estimate of daughters' progeny weaning weight. A bull with a 29 lb. M&G EPD should sire daughters with progeny weaning weights averaging 19 lb. heavier than progeny of a bull's daughters with a M&G EPD of 10 lb. (29 minus 10 = 19 lb.). It is equal to one-half the sire's weaning weight EPD, plus all of his MM EPD. No accuracy is associated with this since it is simply a mathematical combination of two other EPDs. It is sometimes referred to as "total maternal" or "combined maternal."

Maternal Calving Ease (MCE)
MCE EPD predicts how easily a sire's daughters will calve at 2 years of age and is measured on a percentage. For example, if sire A has a MCE EPD of 7 and sire B has a CE EPD of -3, then you would expect on average if comparably mated, sire A's daughters would calve with a 10% more likely chance of being unassisted when compared to sire B's daughters.

Mature Cow Weight (MCW)
The MCW EPD was designed to help breeders select sires that will either increase or decrease mature size of cows in the herd.

The trait was developed after years of raw weight data collection and the EPD relates directly to the maintenance requirements of a cow herd. For example, if sire A has a MCW EPD of 100 and sire B has an EPD of 85, then you would expect the females of sire A, if mated to similar cows, to be 15 lb. heavier at mature size.

Udder suspension (UDDR)
UDDR EPDs are reported on a 9 (very tight) to 1 (very pendulous) scoring scale. Differences in sire EPDs predict the difference expected in the sires' daughters' udder characteristics when managed in the same environment.

For example, if sire A has a UDDR EPD of 0.4, and sire B has a UDDR EPD of -0.1, the difference in the values is 0.5, or one-half of a score. If daughters of sires A and B are raised and managed in the same environment, you would expect half a score better udder suspension in daughters of sire A, compared to sire B.

Teat size (TEAT)
TEAT EPDs are reported on a 9 (very small) to 1 (very large, balloon shaped) scoring scale. Differences in sire EPDs predict the difference expected in the sires' daughters' udder characteristics when managed in the same environment.

For example, if sire A has a teat size EPD of 0.4, and sire B has a teat size EPD of -0.1, the difference in the values is 0.5, or one-half of a score. If daughters of sires A and B are raised and managed in the same environment, you would expect half a score smaller teat size in daughters of sire A, compared to sire B.

Scrotal Circumference (SC)
Measured in centimeters and adjusted to 365 days of age, SC EPD is the best estimate of fertility. It is related to the bull's own semen quantity and quality, and is also associated with age at puberty of sons and daughters. Larger SC EPDs suggest younger age at puberty. Yearling sons of a sire with a .7 SC EPD should have yearling scrotal circumference measurements that average 0.7 centimeters (cm) larger than progeny by a bull with an EPD of 0.0 cm.

Carcass Weight (CW)
Carcass weight is a beneficial trait when considering the impact that pounds have relative to end product value. At the same age constant endpoint, sires with higher values for carcass weight will add more pounds of hot carcass weight compared to sires with lower values for carcass weight. For example if sire A has a CW EPD of 84 and sire B has a CW EPD 64, then you would expect the progeny of sire A, if harvested at the same age constant endpoint, to have a 20-lb. advantage in terms of hot carcass weight.

Rib Fat (FAT)
The FAT EPD reflects differences in adjusted 365-day, 12th-rib fat thickness based on carcass measurements of harvested cattle. Sires with low, or negative FAT EPDs are expected to produce leaner progeny than sires with higher EPDs. Ultrasound measures are also incorporated into this trait and have been shown to be highly correlated with the performance of slaughter progeny. All data is expressed on a carcass scale.

Ribeye Area (REA)
REA EPDs reflect differences in an adjusted 365-day ribeye area measurement based on carcass measurements of harvested cattle. Sires with relatively higher REA EPDs are expected to produce better-muscled and higher percentage yielding slaughter progeny than will sires with lower REA EPDs. Ultrasound measurements are also incorporated into this trait and have been shown to be highly correlated with the performance of slaughter progeny. All data is expressed on a carcass scale.

Marbling (MARB)
MARB EPDs reflect differences in an adjusted 365-day marbling score (intramuscular fat, IMF) based on carcass measurements of harvested cattle. Breeding cattle with higher MARB EPDs should produce slaughter progeny with a higher degree of IMF and therefore higher quality grades. Ultrasound measurements are also incorporated into this trait and have been shown to be highly correlated with the performance of slaughter progeny. All data is expressed on a carcass scale.

Baldie Maternal Index (BMI$)
BMI$ is a maternally focused index that has a production system based on 1,000 Hereford x Angus females with a progeny harvest endpoint directed toward Certified Hereford Beef (CHB®). This index is more critical of CE than the Brahman Influence Index (BII$) and also has significant weight on fertility. There is positive weight on WW and a slightly negative weight on YW, which promotes early growth and then a slow down on growth to keep mature size manageable. The emphasis of IMF is greater than the emphasis of REA. This is true because of the price difference of the Choice-Select spread and the fact that there is very little incentive to produce cattle better than a Yield Grade 3. This index is geared to service any commercial program that has British cross cows.

Calving Ease Index (CEZ$)
This is a general purpose index that focuses on identifying bulls that can be used on heifers and then ultimately the calves will be marketed through the CHB program. As you might expect, CE and MCE carry significant weight in this index along with fertility. There is very little weight put on growth traits and less emphasis on carcass. Remember, this is a general index that is specifically designed to be used in a heifer program.

Brahman Influence Index (BII$)
BII$ is a maternally focused index that is based on a 1,000-head cow herd of Brahman x Hereford cows. The progeny for this index will be harvested in a commodity-based system since CHB does not accept Brahman-influenced cattle into the program. This index has less emphasis for CE than any of the other indexes. There is emphasis on both REA and IMF since the cattle will be harvested through a commodity market. The largest emphasis is in fertility, which is measured solely by SC at the present time. Obviously, the target for this index is the producers in the Southern regions of the U.S. where the bulls are typically sold to commercial cattlemen that have Brahman-influenced cow herds.

Certified Hereford Beef Index (CHB$)
This is a terminal sire index that is built on a production system where Hereford bulls are calves for the CHB market. There is some pressure put on CE and then positive weight on both WW and YW. Remember that all offspring in this index are harvested, so they need to be born alive and then grow fast at all stages of life. Of course, we have much more emphasis on fat in this index, as we want the cattle to stay lean. There is also a significant weight on both REA and IMF with more emphasis again on IMF. This index would be used by producers who have a target of producing bulls for a terminal breeding program. It could be used heavily in the Midwest where bulls are used in rotational breeding programs to produce cattle in a retained ownership program or are simply sold to backgrounders. This is the only index that has no emphasis on fertility. Remember that nothing is retained in the herd.

Missouri

Hereford Association 2019 President's Letter

Dear Hereford Breeders and Enthusiasts,

The arrival of a new calf crop reminds me of the coming of the New Year. Like the New Year, it's the chance for hope, success, and change. It's the time to see if the previous year's breeding decisions were sound ones and whether they will push you in the right direction. I hope this directory finds you with another successful calf crop.

The demand for Hereford genetics continues to be strong across the country. The need for heterosis in our country's black-hided, angus-based cowherd is there and Herefords are just the breed to fill that need. The breed continues to make improvements in carcass quality, performance and growth. The AHA continues to add tools to aid breeders in decision making. While we want to maximize our profits, we also need to keep in mind to watch for traits that aren't measured such as feet and legs, conformation/structure, fleshing ability, and of course, disposition, a trait our breed excels in. Be careful in being so focused on single trait selection that you lose key economic traits such as fertility and efficiency. Remember that it doesn't matter how much performance a heifer has, if she won't breed, she won't make you any money.

I believe we have a stong state association and membership. Our breeders are focused on improving the breed and I believe we have cattle in the state that can go out and work in all parts of the country and industry. We also have a strong junior association that will be coming up to take the reins in the future. We also have a top notch newsletter and website that does a fantastic job promoting our members' breeding operations. I encourage you to visit the website at **www.moherefords.org** to find updates, events, and breeder information. There is also a Facebook page in the works so be watching for it.

We also have a strong board working to improve the association. If you have any questions or concerns please feel free to contact any board member and/or myself and we'll do our best to address your issue(s).

Thank you and God Bless,

Amy Phillips
Missouri Hereford Association President

PROGRESSIVE CATTLEMEN

RELY ON VITAFERM®

Cow Longevity

A cow's value is in her ability to get bred and stay in production. Consistency in breed back and maintaining healthy pregnancies comes down to maintaining ideal body condition. The Jensen Family relies on the longevity of key females to uphold the quality their brand has come to expect.

"The ratio of open cows we have is very slim, and I credit that to a good mineral program because our feedstuff is just like any commercial guy's around here. We don't baby the cows. We might baby them with good mineral and protein, but they are run on milo and corn stalks after pasture just like a commercial guy would do. We understand that supplementing with additional feedstuffs, such as ground hay with distillers, might be advantageous to the cows, but as businessmen, we have to be conscious of our expenses. Our cows are in good shape, obviously, or they wouldn't breed like they do.

Our limited fall-out in our cow herd over the years is a big part of the reason I feel really good about how we're doing things. VitaFerm is a big reason why, I'm sure."

KEVIN JENSEN, JENSEN BROS

If you work in the Cattle Business...

MidwestMARKETER *works for you!*

Purebred, Commercial, Show ring or Auction ring, Midwest Marketer reaches a targeted audience that is interested in one thing: *Cattle.*

No other magazine, paper or website reaches more cattlemen in Iowa , Missouri, Illinois, and surrounding states.

Through constant requalification and updating of our mailing list, our report guarantees that on 1-30-19 Midwest Marketer was mailed to 36,842 cattlemen.

Every week in your

Genetics To Believe In

From Our Family To Yours...

We have raised the bar...

By increasing our genetic base, coupled with extensive AI and embryo transfer, Lowderman Cattle Company has a refreshed direction.

We have strengthened our commitment...

Lowderman Cattle Company's commitment to the beef cattle industry and the Hereford breed is obvious and sincere. Our existing herd consists of over 200 cows and features 15 proven donor cows with over 50 ET calves born annually.

To provide quality & added value genetics...

By continuing to use the best proven genetics available, Lowderman Cattle Company's program is making a difference and resulting in value added genetics for our clients.

Missouri
Junior Hereford Association

The purpose of the Missouri Junior Hereford Association is to provide youth with opportunities for fellowship with others, to learn about the Hereford business, develop leadership skills and promote interest among young people in the Hereford breed.

Membership is open to any Missouri youth who is between 7 and 21 years of age. Members meet each year at the Missouri Cattlemen's Association All-Breeds Junior Show, the Missouri State Fair and the Missouri Hereford Association's Opportunity Sale.

2019 Officers

President **Rachael Bagnell**

FP GUARANTEE

KEEP THEM SAFE EVEN BEFORE DAY ONE. From blankets and bottles to heat lamps and hair dryers — there's not much you won't do to protect your newborn calves. But what about your vulnerable, unborn calves? Zoetis is the only one to offer a complete portfolio of reproductive vaccines backed by the Fetal Protection Guarantee. That means when you immunize Mom against reproductive diseases, she extends that superior protection on to her unborn calf. It's a big step in protecting your calves, even before they take their first step.

LEARN MORE AT FETALCALFPROTECTION.COM.

The Zoetis 100% BVD PI-Free Guarantee and the IBR Abortion Guarantee will be administered through Zoetis Veterinary Medical Information and Product Support (VMIPS) at 800-366-5288. Proof of purchase is required. Calves born to BVD PI-positive cows or heifers do not qualify for the guarantee. This guarantee does not apply to, and Zoetis shall not be liable for, any (x) damages caused as a result of the improper handling, misuse or abuse of the vaccines that are the subject of this guarantee, or the willful misconduct or negligence of any third party, or (y) indirect, punitive, special, incidental or consequential damages. Zoetis reserves the right to modify or cancel the terms and conditions of this guarantee.

All trademarks are the property of Zoetis Services LLC or a related company or a licensor unless otherwise noted.

zoetis

What's the Dogwood Difference?
For over 50 years,
DWF seedstock cattle
have been . . .

Designed With Forage!

Yearling heifers graze alongside the mob of mature cows and steers, learning to compete for and adapt to all kinds of forages.

The results? Our steers can finish on good-quality grass at 15 to 30 months old and bring consistently good prices year after year, direct marketed to loyal beef customers who crave the unique flavor of pasture-finished 100% Hereford beef.

Many of our top-cut bulls have sold to local commercial cattlemen, most of them repeat customers who like even-tempered grass-developed bulls that can go straight to work in the pasture, with no down time. Never over-fattened, grass bulls can remain sound breeders for many years.

Documented stayability:

16's extended pedigree boasts eleven Sires & Dams of Distinction.
C4 is his dam's last calf; she raised him at age 14, with a still perfect udder.
His sire R4 sold for breeding at age eleven.
It's not unusual for DWF bulls to breed for a decade.

In the future, we plan to share forage strategies on our website: https//:www.dogwoodherefords.com, and on-farm forage tours.
